SERVICENOW

Based on the team's analysis of how users log, work and close incidents on the ServiceNow Incident form

Implement Client Script & UI Policy (Incident)

SCENARIO

Logging, working, resolving and closing an incident on the ServiceNow Incident form

	Entice	Enter	Engage	Exit	Extend
	How does someone initially become aware of this process?	What do people experience as they begin the process?	In the core moments in the process, what happens?	What do people typically experience as the process finishes?	What happens after the experience is over?
S Steps What does the person (or group) typically experience?	**Issue reported** Caller reports a problem by phone, email or Service Portal. **Open Incident form** Agent opens Incident > Create New in ServiceNow. **Review the form** Agent sees all fields, including ones not needed yet.	**Select caller & category** Agent picks Caller, Category and Subcategory. **Enter details** Agent types the Short description and Description. **Set Impact & Urgency** Agent sets Impact and Urgency; Priority is calculated. **Submit incident** Agent clicks Submit; the record is saved with a number.	**Assign incident** Incident is routed to an assignment group or resolver. **Work the incident** Analyst sets State to In Progress and adds work notes. **Resolve incident** Analyst sets State to Resolved with resolution details.	**Notify caller** Caller is informed and confirms the fix works. **Close incident** Incident State is set to Closed.	**Review data quality** Team checks incident records for gaps and errors. **Track trends** Reports and dashboards show recurring data issues. **Refine the form rules** Scripts and policies are updated from feedback.
I Interactions What interactions do they have at each step along the way?	Phone, email or Service Portal Incident > Create New (ServiceNow UI) Incident form, default view	Caller, Category and Subcategory fields Short description and Description fields Impact and Urgency fields Submit button; incident number is generated	Assignment group and Assigned to fields State, Work notes and Additional comments Resolution code and Close notes fields	Email notification to the caller State field set to Closed	Incident list view and filters Reports and dashboards Client Scripts and UI Policies in System Definition
G Goals & motivations At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")	Help me report my issue quickly Help me start a new record fast Help me see only the fields I need	Help me pick a matching Category and Subcategory Help me describe the issue clearly Help me set the right priority Help me save a complete record first time	Help me route it to the right team Help me record my work clearly Help me document the fix before resolving	Help me confirm the caller is satisfied Help me close with all required details	Help me spot incomplete records Help me see data quality trends Help me keep the form rules up to date
P Positive moments What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?	Create New opens the form in one click	Category list is clear and familiar Priority is calculated automatically Incident number is generated instantly	Work notes keep a clear audit trail	Caller gets an automatic email update	Reports make poor data easy to find Scripts and policies are quick to build and test in a PDI
N Negative moments What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Resolution fields clutter a new incident form	Subcategory may not match the chosen Category Short description can be left blank Incident can be saved with missing details	Wrong routing when details are incomplete Close notes can be skipped on resolution	Incidents are closed without resolution details	Rework and reassignments waste time
A Areas of opportunity How might we make each step better? What ideas do we have? What have others suggested?	Client Script (onLoad): show a guidance message UI Policy: hide Resolution fields until State is Resolved	Client Script (onChange): clear Subcategory when Category changes UI Policy: make Short description mandatory, add a field hint Client Script (onChange): alert when Impact and Urgency are both High Client Script (onSubmit): Description of 20+ characters; confirm P1	UI Policy: make Caller read-only after save UI Policy: make Close notes mandatory on Resolved	UI Policy: make Close notes mandatory on Closed	How might we flag incomplete records for review? Test as ITIL and end user; capture changes in an Update Set
